

Plainfield Blandford – July 2021

Eversource has made significant progress in the dynamic study analysis of Transient Over Voltage (TOV) and Risk of Islanding (ROI). Eversource requested and received updated PSCAD models from all three customers, which has allowed us to continue the analysis.

Eversource's intention is to keep all customers regularly informed (at least monthly) on the progress and discuss any significant risks or concerns Eversource encounters during the analysis. Factors that may impact the completion schedule and associated activities include but are not limited to: base case modeling issues; DER stability model issues; solution development for potential adverse system impacts; and/or significant Member Impact changes requiring review.

Eversource expects to provide results to customers this Fall.
