

Plainfield Blandford – May 2021

Eversource held a call with group customers April 9, 2021 to discuss the study progress and circulated the presentation with the customers afterwards. Eversource held a customer update meeting on January 15th to review the Steady State analysis results with customers in this group. Eversource has made significant progress in the dynamic study analysis of Transient Over Voltage (TOV) and Risk of Islanding (ROI). To finish the dynamic study, we have requested updated PSCAD models from all three customers and have received the models from one of them. Until we receive updated PSCAD models from all three customers, this group study will be on hold. We will complete the dynamic analysis when we receive the updated PSCAD models.

Eversource's intention is to keep all customers regularly informed (at least monthly) on the progress and discuss any significant risks or concerns Eversource encounters during the analysis. Factors that may impact the completion schedule and associated activities include but are not limited to: base case modeling issues; DER stability model issues; solution development for potential adverse system impacts; and/or significant Member Impact changes requiring review.
